

OCRIS from St. Arnaud Data Management (SADM)

Release V2.2.2.4 – August 2009

OCRIS Logger

Memory usage improvements, improving performance (284)

Removal of 'Data Table' tab from Ocris Logger (149)

Saving to a root directory for an OXO Export file will no longer disable subsequent OXO exports (292)

Clicking outside the grid area at the top of OCRIS whilst the 'Data Entry' tab is selected occasionally resulted in loss of row numbers and grid focus. This has been rectified (294)

Unique column values are checked in combination with each other across a worksheet. For example, if the following columns - 'Depth To', 'Depth From' and 'Sample Id' are all set to be unique, the concatenated field value must be unique - they are not checked individually (269)

Individual user changes to column width are remembered between OCRIS sessions (293)

User is now prevented from activating other processing whilst OXO Export and 'Execute Many' functions are running on the OCRIS Logger. These processes may take some time and it is unwise to start another process until these are complete (295)

Error messages for failed database backups are now more descriptive (295)

OCRIS Updater

OCRIS Updater will not perform the update if OCRIS is currently running (297)

Preview and further information added as part of the OCRIS Updater processing (4)
